

IN THE CLAIMS

The entire pending claim set is provided for the Examiner's convenience. A marked-up version of the claims is provided in Appendix A attached to this document. Please amend claims 1-14 as follows:

1. (Amended) A method of configuring an intelligent network service over a user interface of a mobile station by means of a management application located at an intelligent network node when the mobile station is connected to a mobile communication system which is, in turn, connected to an intelligent network, the mobile station comprising an extension layer to support installable routines, the method comprising:

BI loading a configuration routine of the intelligent network service in question in the mobile station;

the extension layer and/or the configuration routine connected to it receive an input to configure the intelligent network service, generating configuration information on the basis of the input and transmitting the configuration information in a configuration message through a network element of the mobile communication system to said intelligent network node;

the intelligent network node interpreting the configuration information included in the configuration message and configuring the intelligent network service.

SCB
C1
2. (Amended) The method as claimed in claim 1, wherein before the configuration message the mobile station transmits a configuration information inquiry.

1 3. (Amended) The method as claimed in claim 2, wherein the configuration
2 routine is entirely installed in the mobile station before the configuration information
3 inquiry.

1 4. (Amended) The method as claimed in claim 2, wherein the configuration
2 routine is installed only partly, or not at all, in the mobile station before the
3 configuration information inquiry and the network transmits the configuration routine or
B1 4 at least the missing parts of the configuration routine as a response to the
5 configuration information inquiry.

1 5. (Amended) The method as claimed in claim 4, wherein the network
2 transmits the configuration routine or the missing parts thereof only if requested by the
3 mobile station.

1 6. (Amended Twice) The method as claimed in claim 1, wherein the
SCB 2 network element of the mobile communication system recognizes the configuration
3 message and transmits at least the essential part thereof to the said intelligent network
4 node.

1 7. (Amended Twice) The method as claimed in claim 1, wherein the
2 messages between the mobile station and the network element of the mobile
3 communication system are transparent for the portion of the network between the
4 mobile station and the element of said mobile communication system and the network
5 element of the mobile communication system recognizes upward and downward
6 messages and forwards the essential parts of the messages correspondingly to the
7 intelligent network node or the mobile station.

1 8. (Amended) The method as claimed in claim 7, wherein the network
2 element of the mobile communication system recognizes that the message is a
3 configuration message on the basis of the fact that the message contains an intelligent
4 network service identifier and preferably a special character that seldom occurs in a
5 normal text.

1 9. (Amended) The method as claimed in claim 7, wherein the network
2 element of the mobile communication system recognizes that the message is a
3 configuration message on the basis of the fact that the mobile station transmits the
4 message to a telephone number allocated to the intelligent network service.

1 10. (Amended Twice) The method as claimed in claim 1, wherein in
2 connection with changes in the intelligent network service the intelligent network node
3 automatically transmits a notification to the mobile station.

1 11. (Amended Twice) The method as claimed in claim 1, wherein in
2 connection with the changes in the intelligent network service the intelligent network
3 node automatically activates the loading of a new configuration routine for the mobile
4 station.

1 12 (Amended Twice) The method as claimed in claim 1, wherein the
2 messages between the mobile station and the network element of the mobile
3 communication system are data messages, such as short messages or USSD
4 ~~messages.~~

1 13. (Amended) A mobile station comprising an extension layer
2 to support routines to be installed; wherein :
3 the mobile station comprises a configuration routine of an intelligent network
4 service, the routine being arranged to provide the extension layer with an input to
5 configure the intelligent network service;
6 as a response to the input, the mobile station is arranged to transmit
7 configuration information to a mobile telephone network.

1 14. (Amended) An arrangement for configuring over a user interface of a
2 mobile station an intelligent network service controlled by an intelligent network node
3 when the mobile station comprises an extension layer

4 to support installable routines; wherein :

5 the mobile station comprises a configuration routine of the intelligent network
6 service, the routine being arranged to provide the extension layer with an input to
7 configure the intelligent network service;

8 as a response to the input, the mobile station is arranged to transmit
9 configuration information through a network element of the mobile communication
10 system to the intelligent network node; and

11 the intelligent network node is arranged to interpret the configuration
12 information included in the configuration message and configure the intelligent network
13 service on the basis of the configuration information.
